

Social Mobility Within and Between Generations

James J. Heckman
University of Chicago

Econ 350, Winter 2021
This draft, January 11, 2021 2:58pm

Inequality in What? Alternative Measures of Inequality and Social Mobility

We Have So Far Considered

Part 1: Income and Wage Measures

Part 2: Role of Taxes and Transfers in Post-Tax Transfer Outcomes

Part 3: Role of Skills & Skill Prices

Part 4: **Income Mobility**

Part 5: Inheritance of Inequality

Upward Mobility as Families Age

Table 2
Income Mobility of Taxpayers Age 35–40 in 1987 Relative to 2007 Population Age 25 and Over

1987 Income Quintile or Centile Class	2007 Income Quintile or Top Centile Class							
	Income Quintiles						Top Centiles	
	Negative	Lowest	Second	Middle	Fourth	Highest	Top 10	Top 1
Negative	4.0	19.6	26.4	14.3	10.7	24.9	15.6	4.5
Lowest	1.1	38.1	26.3	17.2	9.9	7.2	3.4	0.5
Second	0.6	18.1	23.5	24.4	21.4	12.1	4.2	0.2
Middle	0.6	9.5	15.4	21.2	29.9	23.4	8.0	0.3
Fourth	0.4	6.2	10.7	16.4	27.8	38.5	16.8	0.8
Highest	1.0	4.3	5.3	8.7	20.4	60.4	40.8	6.1
Total	0.7	14.0	15.7	17.6	22.6	29.4	15.0	1.6
Top 10%	1.3	3.8	4.1	6.9	14.8	69.1	52.1	10.7
Top 1%	1.8	3.9	2.4	3.5	6.7	81.7	74.2	36.5

Notes: Both 1987 and 2007 centiles are based on taxpayers age 25 and over. Taxpayers with negative incomes are shown separately from other taxpayers in the lowest income quintile. The five quintiles plus negative incomes sum to 100 percent. Taxpayers not found in 2007 are omitted (see discussion in Appendix A).

More upward mobility when compare individuals against overall population (instead of their peers)

- Individuals aging and moving up lifetime earnings profile
- 60% bottom quintile moves up

Persistence in “Top 1%” – Roughly 40% Drop Out in 1 Yr

Measure how many of those in “Top 1%” are in top after 1 yr, 2 yr,

...

Base Year	T+1	T+2	T+3	T+4	T+5
Panel A: Reoccurrence					
2000	0.53	0.45	0.42	0.42	0.41
2001	0.57	0.53	0.50	0.48	0.47
2002	0.63	0.57	0.53	0.51	0.49
2003	0.63	0.57	0.54	0.52	0.45
2004	0.60	0.57	0.54	0.46	0.41
2005	0.61	0.56	0.47	0.41	0.41
Panel B: Continuous Reoccurrence					
2000	0.53	0.38	0.31	0.26	0.23
2001	0.57	0.44	0.36	0.31	0.27
2002	0.63	0.49	0.40	0.35	0.31
2003	0.63	0.49	0.41	0.36	0.29
2004	0.60	0.48	0.40	0.31	0.25
2005	0.61	0.48	0.36	0.28	0.25

Notes: Panel A (Panel B) shows the probability that individuals in the top percentile of cash income in the base year reappear in a later year unconditional (conditional) on appearing in the top percentile during intervening years. Income percentiles are defined by cash income in each year.

Many drop out after 1 year, even more after 5 years

Figure 1: Intergenerational Mobility and Inequality: The “Gatsby Curve”

$$\text{IGE: } \underbrace{\ln Y_1}_{\text{Income in current generation}} = \alpha + \beta \underbrace{\ln Y_0}_{\text{Income of parents}} + \varepsilon$$

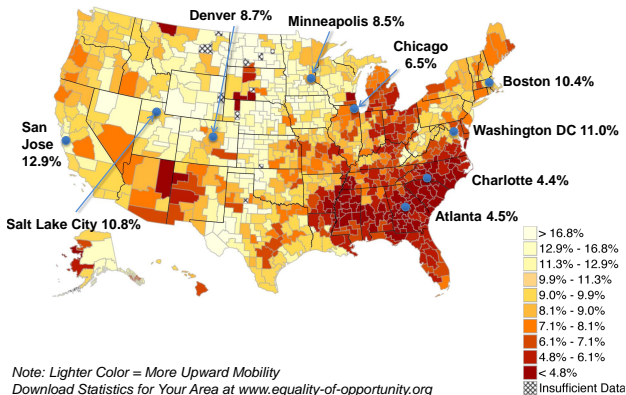

Source: Corak (2013)

- Inequality is measured **after taxes and transfers**.
- Gini index defined on **household income**.
- IGE measured by **pre-tax and transfer** income of **individual** fathers and sons. Notice inconsistencies.

Figure 2: The Geography of Upward Mobility in the United States

Chances of Reaching the Top Fifth Starting from the Bottom Fifth by Metro Area

The ranks are from national income distribution.

Source: Chetty (2016)

Note: The measure of $P(\text{Child in Q5} - \text{Parent in Q1})$ derived from within-CZ OLS regressions of child income rank against parent income rank.

Figure 3: Fig. 3. Trends in absolute mobility: Sensitivity analysis

Source: The fading American dream: Trends in absolute income mobility since 1940.

Figure 4: Child Income Rank vs. Parent Income Rank by Birth Cohort

Source: Chetty et al. (2014).

Some Basic Questions

How to Interpret These Relationships?

What Policies (If Any) Should Be Adopted to Promote Social Mobility? To Reduce Inequality?

Is Income a Proper Measure of Welfare of Agents? Per Capita or Household or Extended Family Unit

Direction of Causality for Gatsby Curve?

- Inequality $\uparrow \Rightarrow \beta \uparrow$?
- $\beta \uparrow \Rightarrow$ inequality \uparrow ?
- Limited access to credit and labor markets \Rightarrow both $\beta \uparrow$ and inequality \uparrow ?
- Family or place? In what proportion?
- What exactly is place? What features determine place?

Understanding the Sources of Inequality and Social Immobility is Essential for Devising Effective Policies

**Families? Schools? Neighborhoods? Peers?
Tax/Transfer Policy? Macro Policy?**

Which Measure of Mobility to Use?

- Rank (positional) Mobility? (and in what distribution?)
- Absolute Mobility (child doing better in real value terms than parent)?
- Mobility Within a Lifetime?

**Recent Cohorts Appear to be Doing Worse Than Previous
Ones:
Effects Concentrated Among Younger Entrants Within
Cohorts
Negative Effects Much More Pronounced for Males**

Figure 5: Percent of Children Earning More than their Parents By Parent Income Percentile

Figure 8: Percent of Grown Children Surpassing the Income of Parents

Source: Winship (2017). Author's analysis of the Panel Study of Income Dynamics (PSID).

Note: The sample begins with all parent-child pairs with income measured at either age 38, 39, 40, 41, or 42, and that single year of income is used (starting with age 40 and moving outward if unavailable). It then is restricted to pairs in which the parent turned 40 after 1974 and the child before 2006. Up to seven years of income are then averaged, using every other year, within a 13-year window. Family incomes are size-adjusted and all earnings and income measures are adjusted for inflation. Sample sizes are 129 for sons, 175 for daughters, and 308 for pooled family income. See Appendix 1 for methodological details.

Figure 9: Percent of Grown Sons in Each Fifth of Male Earnings by Each Fifth of Father Earnings

Source: Winship (2017). Author's analysis of the Panel Study of Income Dynamics (PSID).

Note: The sample includes the 442 father-son pairs where fathers had at least 8 years of non-missing earnings (out of a maximum of 15) and sons had at least 9 years. See Appendix 1 for methodological details.

Figure 10: Percent of Grown Daughters in Each Fifth of Female Earnings by Each Fifth of Mother Earnings

Source: Winship (2017). Author's analysis of the Panel Study of Income Dynamics (PSID).

Note: The sample includes the 854 mother–daughter pairs where mothers had at least 5 years of non-missing earnings (out of a maximum of 15) and daughters had at least 7 years. See Appendix 1 for methodological details.

Figure 11: Percent of Grown Children in Each Fifth of Family Income by Each Fifth of Parental Income

Source: Winship (2017). Author's analysis of the Panel Study of Income Dynamics (PSID).

Note: The sample is restricted to the 719 parent-child pairs where parents had at least 10 years of non-missing income and children had at least 9 years. Incomes are adjusted for family size. See Appendix 1 for methodological details.

Table 1: Summary of Key Measures of Persistence

Measure	Men's Earnings	Women's Earnings	Family Income
Persistence of Relative Inequality			
Intergenerational rank association (rank-rank)	.44-.52 (.51)	.31-.40 (.37)	.51-.53 (.53)
Persistence of Absolute Inequality			
Intergenerational elasticity	.44-.78 (.77)	.27-.54 (.40)	.59-.66 (.66)
Intergenerational correlation	.38-.51 (.48)	.35-.42 (.39)	.51-.53 (.53)
Sibling Similarity			
Sibling rank association	.38-.39 (.39)	.24-.32 (.31)	.36-.43 (.43)
Sibling correlation	.33-.45 (.39)	.22-.31 (.30)	.35-.45 (.45)

Source: Winship (2017).

Note: Estimates are preferred ranges and, in parentheses, preferred point estimates. See the text for selection criteria. Women's earnings compare women to their mothers or sisters. Family incomes are adjusted for family size. All earnings and incomes are adjusted for inflation.

What are Effective Policies to Promote Social Mobility?

Recent Analyses Recognize:

- 1 Fundamental importance of skills in modern economies
- 2 Multiplicity of skills
- 3 The multiple sources of skills
 - a Schools
 - b Families
 - c Neighborhoods and peers
 - d Firms
- 4 The importance of supporting and incentivizing all of these sources of skill
- 5 The importance of the early life origins of adult skills
- 6 Effective targeting by age of skill formation strategies
- 7 Need for evaluations of skill formation approaches accounting for costs and benefits measured in terms of social opportunity costs

A Skills-based Policy Tackles Many Aspects of Poverty, Inequality, and Social Mobility

**Should We Solve Problems As They Arise?
“The Squeaky Wheel Gets the Grease”
OR Should We Target Them to Prevent?**

Is Prevention Efficient? How Well Can We Target?

Skill Gaps Open Up Early

- Gaps in skills across socioeconomic groups open up very early:
 - Persist strongly for cognitive skills
 - Less strongly for noncognitive skills
- Skills are not set in stone at birth—but they solidify as people age. They have genetic components.
- Skills evolve and can be shaped in substantial part by investments and environments.

Impacts by Family Background Status

Mothers' Speech and Child Vocabulary: Hart & Risley, 1995

Children enter school with “meaningful differences” in vocabulary knowledge.

1. Emergence of the Problem In a typical hour, the average child hears:

Family Status	Actual Differences in <u>Quantity</u> of Words Heard	Actual Differences in <u>Quality</u> of Words Heard
Welfare	616 words	5 affirmatives, 11 prohibitions
Working Class	1,251 words	12 affirmatives, 7 prohibitions
Professional	2,153 words	32 affirmatives, 5 prohibitions

2. Cumulative Vocabulary at Age 3

Cumulative Vocabulary at Age 3	
Children from welfare families:	500 words
Children from working class families:	700 words
Children from professional families:	1,100 words

How to Interpret This Evidence

- Evidence on the early emergence of gaps leaves open the question of which aspects of families are responsible for producing these gaps.
- Genes? Eugenics?
- Parenting and family investment decisions?
- Family environments? Neighborhood, peer, and sorting effects?
- The evidence from a large body of research demonstrates an important role for investments and family and community environments in determining adult capacities above and beyond the role of the family in transmitting genes.
- The quality of home environments by family type is highly predictive of child success.

Evidence on the Effectiveness of Early Targeting to Promote Skills (Including Character Skills)

- 80% of adult social problems regarding health, healthy behaviors, crime and poverty are due to 20% of the population.
- Reliable indicators of these problems by age 5
Caspi et al. (2016).

Childhood Forecasting of a Small Segment of the Population with Large Economic Burden

Caspi, Moffitt, et al. (2017)

Social Welfare Benefit Months

20% of Cohort Members = 80% of Total Social Welfare Benefit Months

Concentration of High-Cost Groups in the Dunedin Birth Cohort

Chance Overlap

Observed Overlap

The High-need/High-cost Group in 3 or more sectors: How many health/social services do they use?

Small Footprint of cohort members never in any high-cost group:

Childhood Risk Factors to Describe High-cost Actor Groups: Composites across ages 3, 5, 7, 9, 11

- IQ
- Self-control
- SES (socio-economic status)
- Maltreatment

Summary of findings

- 20% of people contribute 80% of social/health problems.
- A high-need/high-cost population segment uses ~half of resources in multiple sectors.
- Most high-need/high-cost people in this segment share risk factors in the first decade of life;
- Brain integrity in the first years of life is important.

Seen in this way, early-life risks seem important enough to warrant investment in early-years preventions.

Skill Development by Family Background (Consider Just Cognitive Skill)

The Importance of Cognition and Character

- a Major advances have occurred in understanding which human capacities matter for success in life.
- b Cognitive ability as measured by IQ and achievement tests is important.
- c So are the **socio-emotional skills** – sometimes called character traits or personality traits:

- Motivation
- Sociability; ability to work with others
- Attention
- Self Regulation
- Self Esteem
- Ability to defer gratification
- Health and Mental Health

Welfare Subsidized Poverty Enclaves: Detached The Poor from Society

50% of Inequality in Lifetime Earnings Due to Factors in Place by Age 18

Cunha et al. (2005)

- Roemer (2017) reports a similar estimate
- Keane and Wolpin: 90%!

Power of Place

Is Geography Destiny?

Open Question in the Literature: What Are the Mechanisms Underlying the Power of Place?

Sorting and Segregation?

- Segregation: How similar are families who live in the same neighborhood?
 - Can be measured in many different ways
 - Different dimensions of segregation: native / immigrant (binary), education (discrete), income (continuous).
 - Different definitions of areas
- Measure of segregation in income in neighborhoods: Theil (1972), Reardon and Bishoff (2011), can be used to form a scale from 0-1:
 - 0 is no income segregation, 1 is full income segregation
 - 0: All income percentiles equally represented in all neighborhoods.
 - 1: Each neighborhood consists of families from same part of income distribution.

Diversity Score

$$E = \sum_{r=1}^r (\Pi_r) \ln[1/\Pi_r]$$

$$\Pi_r = 1 \Rightarrow E = 0$$

- Π_r refers to a particular racial/ethnic group's proportion of the whole metropolitan area population.
- Measure of diversity

- Unit i within the metropolitan area, such as a census tract, would analogously have its **entropy score**, or diversity, defined as:

$$E_i = \sum_{r=1}^r (\Pi_{ri}) \ln[1/\Pi_{ri}]$$

- Π_{ri} refers to a particular racial/ethnic group's proportion of the population in tract i .

Theil Entropy Index:

$$H = \sum_{i=1}^n \left[\frac{t_i(E - E_i)}{ET} \right]$$

- t_i = total population of tract i
- T is the metropolitan area population.
- $\sum t_i = T$

- E_i and E represent tract i 's diversity (entropy) and metropolitan area diversity, respectively.
- The entropy index varies between 0, when all areas have the same composition as the entire metropolitan area (i.e., maximum integration), to a high of 1, when all areas contain one group only (maximum segregation).
- Diversity score influenced by the relative size of the various groups in a metropolitan area
- The entropy index, being a measure of evenness, is not.
- It measures how evenly groups are distributed across metropolitan area neighborhoods, regardless of the size of each of the groups.

In the U.S., Sorting is High at Both Ends of the Income Distribution

Sorting Increasing

Figure 36: Income Segregation Patterns in the U.S.

Figure 37: Trends in family income segregation, by race

Source: Bischoff and Reardon (2014)

Notes: Authors' tabulations of data from U.S. Census (1970-2000) and American Community Survey (2005-2011). Averages include all metropolitan areas with at least 500,000 residents in 2007 and at least 10,000 families of a given race in each year 1970-2009 (or each year 1980-2009 for Hispanics). This includes 116 metropolitan areas for the trends in total and white income segregation, 65 metropolitan areas for the trends in income segregation among black families, and 37 metropolitan areas for the trends in income segregation among Hispanic families. Note: the averages presented here are unweighted. The trends are very similar if metropolitan areas are weighted by the population of the group of interest.

Similar Phenomena in Denmark

B. Upward Mobility vs. Gini Coefficient in CZ
The “Great Gatsby” Curve Within the U.S.

Source: Chetty et al. (2014).

Note: \bar{r}_{25} is the relative mobility in rank at the 25th percentile.

Figure 53: The Great Gatsby Curve in Denmark

Note: Birth cohorts 1971–1976 (parental income measured as 9-year averages during child generations; childhood; children’s income measured at ages 35–37, ..., 40–42 depending on cohort). Figure shows a scatter plot of “absolute upward mobility” (defined as the expected child rank at parents’ 25th percentile, where ranks are defined in terms of gross income excluding transfers in full population) across municipality-specific Gini coefficients. 15 bins of 6.67% of municipalities.

Figure 54: Distribution of rank-rank estimates across the U.S.

Source: Chetty et al. (2014)

- When we analyze Denmark – a small homogenous country – we see similar variation.

Note: Birth cohorts 1971–1976 (parental income measured as 9-year averages during child generations; childhood; children's income measured at ages 35–37,...,40–42 depending on cohort).

Putting It All Together: Redistribution and Importance of Incentives

A Case Study of Denmark/U.S.

Denmark the Garden of Eden?

Figure 55: Intergenerational Mobility and Inequality

$$\underbrace{\ln Y_1}_{\text{income of child}} = \alpha + \underbrace{\beta}_{\text{IGE}} \underbrace{\ln Y_0}_{\text{income of parent}} + \varepsilon$$

$\beta \uparrow$, Mobility \downarrow

- **Nonetheless, there are steep gradients of children's education in parental education, income, and wealth in both the U.S. & Denmark.**

Evidence for Denmark on the IGE in Education Levels and Trends

- Danish levels in a broader historical perspective.
- Use historical surveys to construct the long run education IGEs for Denmark (preliminary analysis):

Scandinavia invests heavily in child development and boosts the test scores of the disadvantaged (though not to full equality), but undermines these beneficial effects by providing weak labor market incentives.

Tax and Transfer Policy the Main Engine of Scandinavian Reduced Inequality and Enhanced Social Mobility

Static Complementarity

- The productivity of investment greater for the more capable.
 - **High returns for more capable people: Matthew Effect**
 - **Does this justify social Darwinism?**
 - On grounds of economic efficiency, should we invest primarily in the most capable?
 - **Answer: It depends on where in the stage of the life cycle we consider the investment.**

Dynamic Complementarity

- If we invest today in the base capabilities of disadvantaged young children, there is a huge return.
- Makes downstream investment more productive.
- **No necessary tradeoff between equality and efficiency goals.**
- Augmenting this investment by public infrastructure and schools gives agency to people and enhances economic and social functioning.

- Both processes are at work.
- No necessary contradiction.
- Investing early creates the skill base that makes later investment productive.
- Effective targeting.
